This can be achieved if $X \leq P/m$, wherein X represents a deviation in the
main scanning direction of one nozzle in an arbitrary nozzle array from another
nozzle in a nozzle array nearest in the main scanning direction, m is an integer
and P represents a pitch between the adjacent nozzles in one nozzle array. In
the ink-jet recording head configured in this way, it is possible to align the
nozzles projected in the sub-scanning direction at the highest aligning density.
